

Digital Growth Strategy for Disguise Chat

By Riya Singh

Scope: SEO, social media marketing and growth/user acquisition for Disguise Chat (<https://disguise.chat/>), for ages 20 to 40 in India, speaking Hindi and English.

My approach: I studied the product, ran the site through a stack of research tools, cross-checked the findings with my own analysis of the live search results, and built the plan on what the data actually showed. I do not have access to company's Analytics, google search console etc., this plan is made solely using all the available data online. What follows is what I found, the strategic decision it points to, and a prioritised plan across the three pillars.

Tools used: Google Keyword Planner, Google Trends, Ahrefs, Semrush, SpyFu, Majestic, Similarweb, PageSpeed Insights, Rich Results Test, Siteliner, Wappalyzer, AnswerThePublic and SerpAPI.

What I found

1. **The product is invisible in search.** Zero organic traffic, zero ranking keywords, and zero domain authority across every tool. SpyFu shows the domain has never been ranked.

- It is optimised for a phrase nobody searches. The current positioning focuses on “secret messenger,” a term with limited search demand. A stronger opportunity is to emphasize the app’s unique calculator-to-chat functionality and hidden messaging capabilities. Aligning SEO and content around these use cases will better match user search intent, improve discoverability, and capture more relevant organic traffic.

3. **High Search Volume, Misaligned Intent:** While "calculator vault" appears attractive due to search volume, it is primarily dominated by apps focused on hiding photos, videos, and applications rather than private messaging. Instead of competing in a crowded category, Disguise Chat has an opportunity to own the much more specific calculator-disguised messaging niche, where competition is limited and the product's unique value proposition aligns more closely with user intent. High search volume does not automatically mean high relevance. The opportunity lies in owning the messaging-specific segment of the category rather than competing directly with photo vault products.

4. **The website is sound, the backlinks are not.** The website has a strong technical foundation with good desktop performance and a modern technology stack. However, improvements are needed in mobile speed, accessibility, and structured data implementation. The biggest concern is the backlink profile, which appears to contain low-quality and irrelevant links. Cleaning up these links and focusing on acquiring authoritative, relevant backlinks will help improve long-term search performance and domain credibility.

5. **This is an app game, not a website game.** Disguise Chat operates in an app-first category where discovery is driven more by app stores and app review websites than

traditional search engines. To maximize visibility and user acquisition, priority should be given to App Store Optimization (ASO), improving ratings and reviews, optimizing screenshots and app listings, and securing placements in relevant app comparison and recommendation articles alongside ongoing SEO efforts.

The strategic decision

Own the calculator-disguise messaging niche, with a safety-first brand.

Disguise Chat has an opportunity to own the niche of a messaging app disguised as a calculator, a category with limited direct competition and a clear differentiator from photo vault and file-hiding apps. The brand should position itself around privacy, discretion, and personal control, supported by bilingual (English and Hindi) communication tailored to the Indian market. A trust-first approach focused on protecting personal conversations on shared devices is more sustainable, brand-friendly, and advertiser-friendly than messaging that relies on secrecy or controversial use cases.

The Plan

1. SEO strategies

- **Re-target everything** from "secret messenger" to the winnable cluster: calculator-disguise messaging terms ("calculator hidden chat app," "messenger calculator"), plus "secret chat app" (1K-10K searches) and feature terms ("panic code app," "no phone number messenger").
- **App Store Optimisation as the priority**, as discovery in this category appears to be driven primarily by Play Store listings and app recommendation articles rather than traditional websites. Optimizing the app listing around target keywords, improving screenshots, and building a strong base of authentic reviews and ratings can significantly improve visibility and downloads. Performance should then be validated through Play Console data to better understand the contribution of app store versus web-based acquisition channels.

- **Technical fixes:** Prioritize key technical improvements by removing or eliminating low-quality backlinks, optimizing mobile performance by addressing render-blocking resources, improving accessibility standards across the site, and implementing SoftwareApplication schema markup to enhance search engine understanding and increase eligibility for rich search results.
- **A bilingual content engine** targeting how this audience really searches, including Hinglish (for example "calculator me chat hide kaise kare"), led by high-intent pieces: "is it safe," comparison vs Signal, and feature explainers.

2. Social media marketing initiatives

- **Social-Led Growth:** Disguise Chat's growth strategy should be built around short-form content designed for Instagram Reels, YouTube Shorts, Moj, and ShareChat. Given the privacy-focused nature of the product, content should create curiosity, educate users about digital privacy, and showcase the app's unique calculator-to-chat experience without encouraging users to publicly disclose their own usage. The objective is to make privacy relatable, accessible, and shareable while maintaining a trust-first and advertiser-friendly brand image.

The following initiatives transform the app's most distinctive feature the calculator-to-chat reveal into repeatable, low-cost content formats that can consistently drive awareness, engagement, organic sharing, and app installs.

- **Short-form video first.** Focus on short-form video content, highlighting the app's most compelling feature the calculator-to-chat reveal. Instagram Reels and YouTube Shorts are ideal for reaching the target 20 to 40 age group, creating curiosity, demonstrating the product quickly, and driving awareness through highly shareable content.

- **Bilingual content pillars.** Create bilingual content in a natural Hindi-English mix, focusing on key themes such as app demonstrations, privacy awareness, feature explanations, and user stories. Every blog or SEO-focused article should be repurposed into short videos, reels, and carousel posts to maximize reach and maintain a consistent content pipeline across channels.
- **A consistent, safety-first tone.** Maintain a consistent, privacy-focused and trust-building brand voice that emphasizes personal confidentiality, discretion, and user control without referencing sensitive relationship dynamics or surveillance concerns. Position Disguise Chat as a tool for protecting personal conversations and privacy, helping the brand remain advertiser-friendly while building trust with a broader audience.

3. Growth & user acquisition ideas

- **Exclusivity-Led Growth: Access Others Don't Have:** Disguise Chat can leverage exclusivity as a core growth driver by making access feel earned rather than openly promoted. Privacy-focused products naturally benefit from invitation-based experiences, exclusive usernames, limited-edition themes, badges, private communities, and early feature access. These incentives create a sense of belonging and status while aligning with the app's discreet and trust-first positioning.

Instead of relying on public sharing, users are encouraged to join and invite others through curiosity, exclusivity, and gamified rewards. This approach generates organic demand through word-of-mouth, limited-access opportunities, and fear of missing out (FOMO), helping drive user acquisition and retention while maintaining the privacy and discretion that define the Disguise Chat brand.

- FOMO-Led Growth: Act Before It's Gone:** This engine runs on urgency, the worry of missing out if you don't act now. Unlike the exclusivity mechanics, these depend on real deadlines, live competition, or limited windows: badges that close, usernames claimed in real time, themes that vanish, and monthly unlocks. Used sparingly and honestly, since the scarcity has to be genuine to keep trust, they convert curiosity into immediate installs and keep existing users returning so they don't miss the next drop. Each of the eight below carries a clear FOMO trigger.

- Trust, End to End: Earn It Before the Install, Prove It at the Install:** A privacy-focused product must earn trust at every stage of the user journey, from discovery to installation. This strategy combines privacy education with transparency to build credibility and drive adoption. At the top of the funnel, content focuses on educating users about topics such as phone number exposure, metadata, device privacy, and data sharing, helping create

awareness and demand. At the point of conversion, trust is reinforced through clear security information, permission explanations, privacy documentation, and recommended additions such as a data transparency dashboard and public product roadmap. Together, these initiatives create a trust-first growth system that not only attracts users but also gives them confidence to install and use the app.

- Behavioral Trigger Marketing: Market to Moments, Not Demographics:** Most marketing strategies target demographics; this strategy targets moments when privacy becomes important. Rather than promoting features alone, Disguise Chat can create content around everyday situations such as selling an old phone, using public Wi-Fi, sharing a device, starting a new job, or traveling. By connecting the product to real-life privacy challenges, the brand can meet users at the point of need, making its value proposition more relatable and memorable. This approach differentiates Disguise Chat from competitors by focusing on practical use cases and privacy awareness rather than simply marketing app features.

- Product Discovery Partnerships: Get Listed Where People Decide:** People rarely discover privacy apps by searching for a brand name they have never heard of; they are more likely to find them through app comparison articles, recommendation lists, privacy-focused blogs, newsletters, and app-store searches. Our research indicates that these channels dominate search results for relevant category terms, often outperforming individual brand websites. As a result, securing placements in “best privacy apps,” “secure messaging apps,” and similar roundup articles should be a key acquisition strategy. These placements typically attract highly qualified users who are actively evaluating solutions, making them a valuable source of sustained, high-intent traffic and app installs.

- **Market Positioning: Create a Category, Don't Compete in One:** Disguise Chat has an opportunity to position itself beyond traditional messaging apps by focusing on privacy rather than competing solely on security features. While mainstream messaging platforms have made communication convenient and secure, most still rely on phone numbers as the foundation of identity. Disguise Chat differentiates itself by removing that dependency, allowing users to communicate through usernames without linking conversations to a personal phone number. This shifts the conversation from secure messaging to identity-independent communication, creating a distinct market position that is harder to replicate and more defensible than feature-based competition.

6 weeks prioritisation

Weeks 1-2: Foundation and baseline. Disavow the spam backlinks and stop all link buying, fix mobile speed and accessibility, and add SoftwareApplication schema, while setting up tracking across Search Console, Analytics, Firebase, and the Play Console to lock in clean baselines. Claim and audit the Play Store listing now so it is ready to re-target next. Nothing here is user-facing; this fortnight buys the right to compete.

Weeks 3-4: Re-targeting and first content. Re-target both the homepage and the Play Store listing away from "secret messenger" and onto the winnable cluster of calculator-disguise messaging terms, "secret chat app," and the feature long-tail, giving the Play Store equal weight to the website since this is an app-first category. Publish the first bilingual content, leading with the "is it safe" and comparison-vs-Signal pages, each in a natural Hindi-English blend and linked to the download page.

Weeks 5-6: Amplification and discovery. Launch the short-form social calendar built around the calculator-to-chat reveal and feature explainers, on Instagram Reels and YouTube Shorts for the core audience and Moj and ShareChat for Hindi reach, holding the safety-first tone. Start review-building to lift the Play rating, since rating drives ranking in this category, and begin outreach to the "best privacy apps" and "secure messaging" roundups and directories where this audience actually decides.

Beyond week 6: Scale what pays back. Run the anonymity-safe referral programme and the exclusivity and behavioural-trigger initiatives, begin small and measured paid tests, build out the trust assets that lift conversion at install, and scale whatever the data shows is paying back while cutting what is not.

How I would measure success

For a project at this stage, I would recommend setting up the following metrics and tools:

MEASUREMENT	
Metrics & Tools	
METRIC	TOOL
Website traffic, user behavior, conversions	Google Analytics 4 (GA4)
Indexed pages, keyword visibility, search clicks & impressions	Google Search Console
Keyword rankings (Top 100, Top 20, Top 10)	Ahrefs / SEMrush / SE Ranking
Backlink growth and authority tracking	Ahrefs
Technical SEO monitoring	Google Search Console + Screaming Frog
Play Store impressions, store listing performance, installs	Google Play Console
App retention, engagement, acquisition channels	Firebase Analytics
User reviews, ratings, review trends	Google Play Console
App attribution and campaign tracking	AppsFlyer or Adjust (if running paid campaigns)
Social media reach and engagement	Native platform analytics (Instagram, YouTube, etc.)

For a project at this stage, the first priority is establishing a reliable measurement framework to track growth across SEO, app store visibility, and user acquisition. The recommended tools and metrics are outlined below to provide a clear view of performance and identify opportunities for optimization. With virtually no existing traffic or visibility, success should initially be measured through leading indicators rather than installs alone. Key metrics include indexed pages, search impressions, keywords entering the Top 100 rankings (particularly for low-competition calculator-disguise messaging terms), Play Store listing impressions, review volume and average rating, website traffic, and app installs.

As more first-party data becomes available through Google Search Console, Google Analytics 4 (GA4) and Google Play Console, measurement can evolve toward higher-impact business outcomes such as keyword rankings, organic user acquisition, app engagement, retention, and sustained install growth.

Assumptions and what I would validate first

- I did not have the company's Analytics or Search Console, so traffic figures are from third-party tools and the audience profile. The first step on day one would be installing tracking.

- Search volumes for the niche disguise-messaging terms came from my own search-results analysis; I would confirm them in Keyword Planner before committing a budget.
- The spam backlinks suggest either a cheap link package was bought or a negative-SEO attack; Search Console would confirm whether they caused a penalty.

In one line: Disguise Chat's challenge is not the product, it is discoverability. By owning the calculator-disguised messaging niche, prioritizing App Store visibility, and turning the calculator-to-chat reveal into a scalable content engine, the brand can build a defensible position in a category with limited direct competition.
